PROFILE

Backend Engineer specializing in AI-powered systems and distributed pipelines, with production experience reducing LLM costs and building multi-agent orchestration at scale with LangGraph at scale.

EXPERIENCE

BirdEye

Apr 2025 – Present

Backend Engineer

Remote

- Built a customer-facing AI theme generation platform using Spring Boot, Kafka, MySQL, MongoDB, and Elasticsearch to process review and survey data into semantic business themes, reducing recurring LLM costs by **\$20k–\$25k per month** and moving processing frequency from **every page reload to once every 7 days**.
- Designed asynchronous Kafka-based workflows to decouple long-running NLP processing from API request flows, improving scalability and responsiveness for **thousands of customer business accounts**.
- Developed an intelligent bulk competitor onboarding pipeline that automatically maps and de-duplicates competitor locations, reducing onboarding effort from **4–5 hours to under 10 minutes** for enterprise accounts with hundreds of locations.
- Built LangGraph-based workflow orchestration for multi-location query handling and conversational clarification, improving SQL generation accuracy and preventing incorrect analytics for **multi-location business accounts**.
- Implemented a long-term conversational memory service for AI-generated charts and analytics, enabling **indefinite multi-turn conversations** while maintaining bounded token growth and reducing repeated context-processing overhead.
- Optimized external API integrations with caching and retry strategies, reducing average API response latency from **~5 seconds to ~3 seconds** and lowering third-party API costs by approximately **40%**.
- Reworked AI cache lifecycle and competitor management flows, eliminating stale-cache inconsistencies, preserving **historical analytics data**, and reducing expensive cascading database operations to **constant-time status updates**.
- Improved engineering quality and release reliability by increasing unit and integration test coverage from **0% to ~90%**, significantly reducing production regression issues and manual QA effort.

Amadeus Labs

July 2023 – Apr 2025

Software Development Engineer - 1

Bengaluru, Karnataka

- Led migration of **40+ applications** in FareXpert Tech Upgrade, cutting delivery timelines by 30% and reducing long term maintenance overhead.
- Redesigning application boot architecture by replacing legacy JNLP distribution with optimized packaging, reducing startup time from **6 minutes to 10 seconds** for **250+ global airline clients**.
- Owned On call rotations for Java production systems, driving root cause analysis and cross team fixes that cut recurring incidents and improved mean resolution time by **30%**.
- Received Pacesetter Award for exceptional delivery and high standard deliveries.

Amadeus Labs

Feb 2023 – July 2023

Software Development Engineer - Intern

Bengaluru, Karnataka

- Led migration of Prototyped the FareXpert Tech Upgrade migration framework across pilot applications; prototype validated feasibility and was greenlit, leading to full-time conversion and expansion to 40+ applications.
- Received Best Java Internship recognition for outstanding contribution and delivery during the FareXpert prototype phase.

SKILLS

Languages: Java, Python, GoLang, JavaScript, Bash

Backend: Spring Boot, Kafka, Redis, REST APIs, Microservices, Distributed Systems

Databases: PostgreSQL, MySQL, MongoDB, Oracle, Elasticsearch, Snowflake

Tools/Tech: AWS, LangGraph, LangChain, Apache NiFi, Git, CI/CD

Frontend: Angular, React

EDUCATION

Thapar Institute of Engineering and Technology

2019 – 2023

B.E. in Electronics Engineering — CGPA: 8.25

Patiala, Punjab
